Background on our the noise data

How the numbers were made

A person walked 8.81 miles of street around 167 East 121 Street carrying a sound sensor that logs about one reading a second with a GPS fix: 11,290 readings, 10,185 with a loudness value. Each is snapped to the nearest street centreline within 75 feet, and readings with GPS accuracy worse than 50 metres are dropped. Horns are detected by our own model, at most one per reading.

What was walked, and what was not

The 88% coverage figure is 8.81 of the 9.96 street miles inside the 1.05 km² block of streets around this address. About 95% of that block sits inside East Harlem North, so the name locates the walk rather than bounding it. The readings fall in 8am–12pm, 12pm–4pm; the rest of the day was not walked and nothing here describes it.

What this report does not cover

Every reading was taken on the sidewalk, so nothing here is an indoor level, a level at a given window or floor, or anything behind a building line. The outlined parcel marks the address, and no reading is attributed to it. This report does not name the source of a level (subway, bar, construction), does not describe an hour nobody walked, and does not predict a future day.
